

Jesse Laguna

San Jose, CA | (209) 930-0185 | jessealaguna@gmail.com | jesselaguna.github.io | github.com/jesselaguna

PROFESSIONAL SUMMARY

Current student at San Jose State University with an Accounting foundation and technical work in both Python and AI systems; looking for entry level positions to integrate both disciplines.

EDUCATION

B.S. Business Administration, Emph in Accounting — San Jose State University *Expected May 2027*

- Relevant coursework: Financial Accounting, Managerial Accounting, Intermediate Accounting, Business Law, Macroeconomics, Business Calculus, Information Systems.

EXPERIENCE

Software Developer | Independent Contractor - San Jose, CA *Jun 2026 - Present*

- Built and currently maintaining a billing application for a local smog-check shop. Editable invoices, multi user access with per-user authentication, deployed and in daily use by the shop owner and a second operator. Ongoing feature work and support.

Private Tutor | San Jose State University - San Jose, CA *Aug 2025 - Present*

- One-on-one academic tutoring for high school students. Student-directed format targeting whichever subjects each student is currently struggling with, adjusted week to week across multiple subjects.

Barback | Courage Anyone - San Jose, CA *Nov 2025 - Jun 2026*

- Supported high-volume bar operations - inventory movement, restocking, and service flow during peak shifts, while carrying a full time course load and tutoring between classes.

ACCOUNTING & AI PROJECTS

Independent Model Validation, SR 11-7 Style (Python, LightGBM, deepchecks, giskard)

- Validated a self-built machine-learning trading model against Federal Reserve / OCC model-risk standards. 463,736 observations, 8-fold walk-forward testing, leakage controlled out of sample harness. Found the edge was not distinguishable from zero and issued a not-approved-for-deployment verdict. Report and reproducible checks published at github.com/jesselaguna/ml-model-validation.

CNN, Trained From Scratch - Object Tracking (Python, PyTorch, OpenCV)

- Built a compact CNN (~24.8K params, ~22ms CPU inference, no pretrained weights) to track a moving object whose color falls below the human-perceptible threshold from its background, after motion-based and color-based detection both failed for measured reasons. Designed an active-learning labeling loop, an honest (non-shuffled) train/validation split, and a confidence gate tuned from real data rather than guessed. Code and documented methodology published at github.com/jesselaguna/fish-tracker-cnn.

Small-Business Accounting Simulation - QuickBooks Online

- Completed a full accounting cycle for a simulated company: transaction entry, chart of accounts organization, bookkeeping tasks, financial data review, and business reporting.

SKILLS

- **Accounting** - Bookkeeping, journal entries and ledgers, reconciliations, financial statements, financial analysis, QuickBooks Online workflow, Excel.
- **Technical** - Python, Local LLM Deployment (Ollama), retrieval systems and semantic search (ONNX embeddings), REST APIs, model validation (deepchecks, giskard), LightGBM, OCR Document Extraction, Tailscale Networking.
